

- ◀ Csurős subset-only ML (reference baseline; min = 4 from Csurős 2026 PNAS bundled rates) ★ observed cp/fm at the subset's median-fm leaf (what the fits should reproduce at the leaf tip)
- ✚ our MAP Brownian $\sigma = 1$ (recommended baseline; tree-Brownian autocorrelated log-rate prior) ■ violin — observed cp/fm over the other leaves of the subset
- ✚ our Brown-extend ML (warm-started from MAP Brownian, short pure-ML fine-tune)
